

Varendra University

Department of Computer Science and Engineering
5th Semester Final Lab Assignment (Spring-2026)

Course Code: CSE 3104

Course Title: Database Management System Lab

Section	A
---------	---

Consider the following tables:

Table: Orders

Order_No	Purchase_amount	Order_Date	Customer_ID	Salesman_ID
70001	150.5	04-10-2025	3005	5002
70009	270.65	11-03-2026	3001	5005
70002	65.26	05-05-2026	3002	5001
70005	2400.6	27-02-2026	3007	5001

Table: Salesman

Salesman_ID	Name	City	Commission
5001	James Hoog	New York	0.15
5002	Nail Knite	Paris	0.13
5005	Pit Alex	London	0.11
5006	Mc Lyon	Paris	0.14

Create these two tables and solve the queries.

1. **Construct** a SQL view named Sales_Report that joins both tables to display the ord_no, the salesman name, and the purch_amt for all transactions.
2. **Design** a **unique non-clustered index** for the salesman table on the salesman_id attribute.
3. **Develop** a stored procedure named spGetOrdersByCity that takes a city name as an input parameter and returns the salesman name and their corresponding purch_amt by joining both tables.
4. **Formulate** a stored procedure named spCountHighCommission that takes a threshold value as an input and uses an **OUTPUT parameter** to return the total number of salesmen who earn a commission higher than that threshold.
5. **Execute** a DML operation to **Delete** all records from the orders table where the purch_amt is less than 100.
